

VidyaSetu connects aspiration to verified opportunity

Phase 2 MVP. A voice-first AI Bridge engineered for first-generation, rural, and low-income learners in India.

Precision routing over open-ended generation

Generic AI Chatbot

- Text-reliant and heavily form-based.
- Generic job search categories and unchecked claims.
- Open-ended, unverified advice prone to hallucination.
- Zero visibility into local safety or distance constraints.

VidyaSetu AI Bridge

- Voice-first intake via vernacular STT/TTS (Sarvam).
- Career discovery locked to specific, practical pathways.
- Strict safety flagging for loan risks and fee transparency.
- Hyperlocal unsafe commute flagging based on exact location.

A trusted network built on verifiable proof

Engineered exactly to the Phase 2 rubric standards

20% Completeness

Voice-first onboarding, profile, pathway, journey, proof, opportunities completed.

10% Pilot & Scale

Partner onboarding model and cost controls established.

15% Evaluation

Automated persona tests complete; mentor loop next.

15% Equity & Trust

No fake contacts, strict consent gates, worker reviews.

25% AI Robustness

Claude-generated pathways on real inputs; automated suites are green.

15% Real-world Readiness

Regional language UI, shared-phone assumptions, daily WhatsApp reminders.

Perfect automated scoring across all core evaluation metrics

9/9

Live Counselor Profile Tests

Correctly extracts goal, education, location, time, phone access, commute, and proof signals from chat without repeating intake questions.

5/5

Vernacular Pathway + Voice Tests

Generates precise pathways and playable Sarvam TTS audio across Hindi, Odia, Tamil, Bengali, and Marathi flows.

156/156

Journey and Smoke-Suite Checks

Flawless execution across Slice5 (journey progress, passport gating) and Slice6 (no-location guards, study/job/informal skill flows).

Summary Insight: The AI layer changes behavior across job, training, and enterprise cases without relying on static UI wrappers.

Stable routing across extreme edge-case constraints

Ground-truth validation confirms the need for hyperlocal routing

• **Employer Validation** •

Kanpur Clothes Factories

- Employers positively validated the concept of a structured, filtered hiring pipeline.
- Confirmed that candidate proof, basic profiling, and upfront consent drastically reduce unfiltered screening effort.

• **NGO Validation** •

Shiv Shakti Foundation

- Confirmed necessity of voice-first interfaces for learners with constraints.
- Reinforced that the system must remain hyperlocal; restrictions regarding unsafe commutes, family permission, and local opportunity quality vary sharply by learner.

A live, web-first production stack built for low-end Androids

Strict safety gates prevent automated harm

A 12-week phased path to hyperlocal adoption

Predictable unit economics optimized for scale

Rs 10–30

(\$0.15–\$0.35) — Indicative
AI cost per complete
active learner

Cost Efficiency

Strategic routing uses Claude Haiku first for speed, saving Sonnet only for deep counselor turns.

Active Learner Profile

Budget accounts for counselor interactions, one pathway generation, one journey generation, and 0-2 search calls.

Pilot Budget

The recommended 50-learner field pilot requires an estimated all-in budget of \$25-\$75+ (including AI, voice, infrastructure, and WhatsApp costs).

Partner-funded sustainability keeps learners protected

Core Principle: VidyaSetu remains 100% free for learners. It does not spread as a generic chatbot, but as a local operating system for learner support.

Pillar 1: CSR & NGO Cohort Funding

Partners fund cohorts to support measurable learner outcomes and structured livelihood readiness.

Pillar 2: Employer Hiring Support

Local employers support the platform because proof-filtered, consented pipelines drastically reduce screening effort and build trust.

Pillar 3: District & State Adoption

Public-private integration with existing skilling schemes, protected by strict privacy, audit, and grievance processes.

Continuous **monitoring** ensures **systemic integrity**

Daily Maintenance Cadence

Tracking failed WhatsApp reminders, proof completion statuses, and unsafe opportunity requests via the Admin CRM.

Reviewing API errors, model timeouts, malformed JSON outputs, and latency limits across Vercel and Supabase logs.

Monitoring sudden cost spikes, Anthropic usage thresholds, and Sarvam failure logs to ensure budget constraints hold.

System Alerts: Dedicated human-in-the-loop interventions triggered by ADEWS-style silence alerts for inactive learners.

The AI Bridge is tested, safe, and ready to deploy

Voice-first.

Outcome-first.

Trust-first.

The Final Claim

The Phase 2 MVP demonstrates robust AI functionality, vernacular onboarding, proof-based journey creation, and strict consent gating.

The Ask

Partner with VidyaSetu for a 20-50 learner controlled hyperlocal pilot. Help us transition first-generation learners from aspiration to verified opportunity.
